Ursodeoxycholic Acid

Newborn use only

Alert	Hyperosmolar suspension. In-house suspension has an osmolality of 1030 mOsm/kg. ¹⁵		
Indication	Treatment of neonatal cholestasis		
marcation	Pretreatment for hepatobiliary scintigraphy (DISIDA or HIDA scan)		
	Adjuvant therapy for unconjugated hyperbilirubinemia has been reported		
Action	Naturally occurring hydrophilic bile acid. Oral administration increases hydrophilic bile acid,		
	replacing/displacing toxic concentrations of endogenous hydrophobic bile acids that tend to		
	accumulate in cholestasis. Other actions include protection of the injured bile duct epithelial cells		
	(cholangiocytes) against toxic effects of bile acids, inhibition of apoptosis of hepatocytes,		
	immunomodulatory effects, and stimulation of bile secretion by hepatocytes and cholangiocytes. ^{8,9}		
Drug type	Bile acid		
Trade name	Ursofalk Suspension [Dr Falk Pharma] ⁸ or suspension compounded by local pharmacy		
Presentation	50 mg/mL oral suspension		
Dose	Neonatal cholestasis		
	10-15 mg/kg/dose 12 hourly ¹⁻⁵		
	Pretreatment for hepatobiliary scintigraphy (DISIDA or HIDA scan)		
	10 mg/kg/dose 12 hourly for 48-72 hrs prior to scan and continue until scan is over. ¹⁶		
	Adjuvant to phototherapy in term neonates has been reported.		
	5 mg/kg/dose 12 hourly (until phototherapy is ceased) ¹⁰⁻¹⁴		
Dose adjustment	No information.		
Maximum daily	30 mg/kg		
dose			
Total cumulative			
dose			
Route	Oral/intragastric		
Preparation	Not applicable		
Administration	Administer mixed with 1-2 mL of milk/sterile water into infant's mouth through a feeding teat or via		
	intragastric tube.		
Monitoring	Liver function and total and direct serum bilirubin.		
	Observe stool colour.		
Contraindications	Hypersensitivity to ursodeoxycholic acid.		
	Complete biliary obstruction.		
Precautions			
Drug interactions	Antacids which contain aluminium bind to ursodeoxycholic acid and reduce its absorption.		
Adverse	NOTE: Hyperosmolar suspension. In-house suspension has an osmolality of 1030 mOsm/kg. ¹⁵		
reactions	Adult data ⁹		
	Dermatologic: Rash		
	Gastrointestinal: Constipation, diarrhoea, indigestion, vomiting Musculoskeletal pain		
	Respiratory: Bronchitis, cough, pharyngitis, upper respiratory infection		
	Immunologic: Hypersensitivity reaction		
Compatibility	Not applicable		
Incompatibility	Not applicable		
Stability	Discard 4 months after opening.		
Storage	Store below 25°C.		
Excipients	Ursofalk suspension: benzoic acid, purified water, xylitol, glycerol, Avicel RC-591, propylene glycol,		
	sodium citrate dihydrate, sodium cyclamate, citric acid, sodium chloride and 87017 lemon flavour		
Special

Evidence	Efficacy		
	Treatment of parenteral nutrition associated cholestasis (PNAC): A cross-over randomised		
	controlled trial compared the effectiveness of phenobarbital versus ursodeoxycholic acid (UDCA) in		

Ursodeoxycholic Acid

Newborn use only

	10mg/kg/day or 20mg/kg/day in 12 hourly doses along with phototherapy. There was a higher rate of fall in serum bilirubin and less duration of phototherapy required in children receiving UDCA. However, there was no difference in the group receiving 10mg vs 20 mg /kg/day. ¹² In a double blind RCT by Shahramian et al, term neonates of 3-5 days age under phototherapy were randomly divided into intervention (phototherapy+ UDCA) and control (phototherapy alone) groups. The intervention group received 15 mg/kg UDCA daily. Total serum bilirubin levels at 24, 48 and 72 hours after therapy were significantly less in UDCA group. The ratio of neonates with total bilirubin< 10 mg/dL were 28% and 55% after 48 hours, and 64% and 90% after 72 hours of therapy initiation in phototherapy alone and phototherapy+ UDCA groups respectively (P< 0.001). The mean reduction of direct bilirubin was not significantly different between the groups. ¹³ In a RCT by Akefi et al, 220 term neonates receiving phototherapy for non-haemolytic jaundice were randomly assigned to phototherapy group (Control group) and phototherapy plus UDCA group (Intervention group) as 10mg/kg/day in 2 divided doses. The mean age of the control and intervention group was 5.3 and 4.9 days, respectively. Reduction in total bilirubin level was significantly more in UDCA group. However, there was no significant difference in mean of the duration of phototherapy. ¹⁴
Practice points	UDCA is effective in reducing direct serum bilirubin and duration of PNAC in neonates. (LOE III-2; GOR
	B) ¹⁻⁵ Prophylactic usage of UDCA can be considered in infants with prolonged PN. (LOE III-2; GOR D) ^{6,7} UDCA may be considered as an additive therapy to phototherapy in term neonates with indirect hyperbilirunemia to facilitate faster decline in total serum bilirubin. (LOE III: GOR C) ¹⁰⁻¹⁴
